To the Clay Mathematics Institute

Dear President,

I have solved the grand unified theory.
It solves every one of your Millennium Prize Problems.

It is not published because the physics establishment has enshrined $E = mc^2$ as a sacred law rather than the approximation it truly is. My equation expands it to cover everything from momentum to the multiverse, including antimatter, dark matter/energy and the wave-particle duality of light, in a single, consistent framework. It corrects all known physics and fills every mystery—known and unknown—that your community has spent a century stumbling.

It also proves that Stephen Hawking's chronology protection conjecture was a clown's attempt to hide what he could not solve.

I propose a contest of my own:

- You contact a reputable publisher and arrange for my complete work to be published under my name, including the solutions to all seven Millennium Prize Problems.
- I will claim only one of the prizes, saving you five million dollars.

If even one claim in my work is proven incorrect, I will never attempt physics again for the rest of my life.
I will also issue a public apology for the following statement:

"The physics community are a bunch of blowhard windbags that are so full of themselves they have to hang a bucket from their arse's just to catch the overflow, further their noses are buried so far up each other's arse that they have lost the sense of smell for the shit they all dribble."

The grand unified theory is copyright protected. Every technology I have blueprinted—from spatial distortion (phone-booth-sized homes) to nuclear-blast shields and backpack-sized antimatter power stations—is also protected. I have blueprints for so many technologies that they cannot fit in a single email. I simply cannot afford to build them.

I dare you to take this challenge. A fair fight: my physics against the current clown theory.

Your institute can be framed as the light for future physics or the protector of everything wrong with the system. A potential partner in the new, or remain in the dark ages of the old.

Sincerely,
Peter Thompson
